Syllabus for GEOL1100: Global Physical/Descriptive Oceanography or, Notions for the Motions of the Oceans

1 Contacts

The professor for this class is: Baylor Fox-Kemper

baylor@brown.edu
401-863-3979
Office: GeoChem room 133

Some portions of the website are password-protected to ensure that fair use and copyrights are correctly obeyed as I share images from books, etc. You can access these by using:

username: io
password: ocean

2 Getting Help!

I am usually available by email. You can make an appointment other times. Just check my calendar at http://fox-kemper.com/contact and suggest a time that works for you.

3 Goals

In this class you will:

• Learn about many of the physical processes that occur in the ocean.
• Learn about how these physical processes are observed, budgeted, and quantified.
• Learn about where these processes occur in the ocean.
• Learn about and access recent ocean datasets.
• Get practice writing and thinking scientifically by focused study on particular processes.
• You will also get a broader perspective and more practice by peer reviewing your colleagues’ efforts.
• You will benefit from the reviews of your writing by your peers.

A list of the basic topics covered in this class is:

• Observations
  What instruments are common to oceanography?
  How are these measurements used?
  How do the types of measurements influence the theoretical developments?

• Fluids Mechanics
  The differential equations describing a fluid
  The differential equations describing a Boussinesq fluid
  How the differential equations relate to budgets
  How the differential equations may be reduced to a dominant balance for particular phenomena
  What non-dimensional groupings may be used to identify which dominant balance is likely
• Rotation
  The equations for fluid motion in a rotating frame of reference
  Ekman layers and balance
  Geostrophic balance

• Stratification
  The temperature, salinity, and density stratification of the ocean
  Hydrostasy
  Baroclinic and Barotropic
  Potential temperature and potential density
  Thermal wind balance

• Vorticity balances
  Taylor-Proudman Flow
  Sverdrup Flow

• Ocean Circulation
  The Wind-Driven Ocean Circulation
  Western Boundary Currents
  Antarctic Circumpolar Current
  The Meridional Overturning Circulation
  Theories of the Thermocline
  The pressure distribution of the ocean

• Forcing
  Air-sea exchanges of sensible & latent heat, momentum, energy
  Radiation forcing (shortwave=solar and longwave)

• Wave Basics
  Dispersive Wave Kinematics: Phase & Group velocity
  Important kinds of ocean waves: surface gravity, internal gravity, Rossby, Kelvin
  Eddies versus waves

4 Meetings and Places

We will meet Tuesdays and Thursdays from 1 to 2:20PM in GeoChem 029. Office hours will be by appointment (see my schedule at [http://fox-kemper.com/contact](http://fox-kemper.com/contact)).

The student computer lab in GeoChem should have the software we’ll be using (primarily matlab) loaded. You can download a copy of matlab for yourself from [http://software.brown.edu/dist/index.html](http://software.brown.edu/dist/index.html) for free. The Java Ocean Atlas is available from the textbook website.

4.1 Calendar

The main webpage for the class [http://fox-kemper.com/1100](http://fox-kemper.com/1100) will have the calendar with all assignment deadlines, readings, etc. set up by the first class session. The three big paper assignments will be due near the last day of February, March, and April, respectively.

5 Canvas and Websites

The primary resource for this class is the webpage: [http://fox-kemper.com/1100](http://fox-kemper.com/1100). The class webpage is where all of your assignments will be announced, links to reading will be posted, etc.
The second web resource are the pages for the class. I will also be experimenting with turning in assignments on canvas, although that may be too clunky in which case we'll just do it by email.

You will want to familiarize yourself with Google Scholar (http://scholar.google.com) and the Web of Science (http://apps.isiknowledge.com). Both are free to you, and they will help you with your paper preparations.

6 Textbooks and Software

We will use two primary textbooks: Descriptive Physical Oceanography (Talley et al., 2011) and Ocean Circulation (Colling, 2001). The first one is required and supplementary material can be found at http://booksite.academicpress.com/DPQ/. The second one is available through the library at http://site.ebrary.com/lib/brown/docDetail.action?docID=10190755 (you must be on campus or hooked in with VPN or the library’s EZproxy to access). You can also find it at http://josiah.brown.edu/record=b6237449~S2. More mathematical detail can be found in other textbooks (Vallis, 2006; Cushman-Roisin and Beckers, 2010). Two good online textbooks are (Tomczak and Godfrey, 1994; Stewart, 2008), which are linked from the course webpage.

All of the required readings will be posted on the website. Hard copies of many of these books, as well as some others you should become familiar with are in the Science Library. I recommend browsing a bit and seeing what there is (Dewey Decimals GC11, GC150, and QC809 are good places to start).

The class will require use of software capable of opening ocean datasets. I strongly recommend matlab, but you could use Java Ocean Atlas, IDL, Ocean Data View, or ferret (although I will be less able to offer help!). All of these are available to you free for PC, Mac, and Linux.

7 Assignments and (lack of) Exams

There will be three major assignments for this class, and all of them will be in the form of short scientific reports. You will often be working on two assignments at a time, reviewing and revising the last one (a little work), and preparing the next one (more work). There will also be short homework assignments based on lectures and reading. There will be no additional exams or midterms. The final revision of the final paper is presently scheduled to be turned in at the end of exam week, although I have tried to schedule sufficient time the preceding week so that it can be completed before exams. The weighting of the assignments will be:

• 10% Plans for papers.
• 30% Original submission of papers.
• 20% Revised submission of papers.
• 20% Reviews of other students’ papers.
• 20% Reading quizzes.

What can I do to get a good grade? Turn all of the assignments in on time. For the format of the course to work, ON TIME matters, so that we can get to the reviewing.

Assignments are to be in pdf file format and created according to American Geophysical Union Geophysical Research Letters templates. If you want to use LaTeX, the software is already loaded in the learning lab and I can help. If you want to use something else, you can download the AGU templates, but you’re on your own if things go wrong!

The scheduling of the assignments are listed on the webpage, and other than the exceptional week around fall break will be as follows.

• Paper assignment #n will be due on a Friday at 5 PM. They will be submitted electronically.
• By Monday at noon, you will receive two of your colleagues’ #n papers to review electronically. Who is reviewing whom will be anonymous.

• On Tuesday, we will have class and office hours. You can discuss anything with me or the class about your paper or the papers you are reviewing (#n) or paper #n + 1 that you have already begun thinking about. Be careful to preserve your reviewer anonymity!

• On Wednesday by 5 PM, your reviews of your colleagues’ two papers (#n) are done and submitted electronically to me.

• By Thursday midnight, I will have your paper #n back to you, with my reviews and your peer reviews. Discussion during office hours is encouraged of returned paper #n.

• The following Wednesday at 5 PM, a revised version of your paper is due.

• That Friday, a summary of what you plan to do on paper #n + 1 is due. I encourage you to have generated some results and looked for some references. I will respond by email with suggestions for the following week.

• The following Friday, paper #n + 1 is due, and the process restarts.

All of this will be charted out on the calendar on the website and in CULearn.

Before you get worried about writing five papers for one class, let me explain the goals of the paper writing. These are not supposed to be polished, ready to submit papers detailing years of research. Instead, they are supposed to be practice in writing drafts for your real research. The idea is to get used to pounding out a working draft in only a couple of hours, so that when the time comes for you to do it for real, that part will be easy.

Since you all have different preparation, you will all be able to take advantage of what you know. However, we are working to develop elements in all of the following:

• Quantitative Skills and Equations for the Ocean (Theory/Modeling Component)
• Descriptive Skills and Geography of Ocean Currents (Descriptive Oceanography)
• Understanding of Ocean Observations and Techniques (Observations/Engineering Component)
• Physical Intuition and Dynamical Understanding (Theory/Dynamics Component)
• Implications for Climate, Society, etc. (Policy & Climate Component)

By the end of the semester, you should have addressed each element somewhat in some of your papers. I hope you will get inspired along the way, and you can revise one of these little papers into a real paper or a prelims or honors project, but don’t get upset because you have to hit the ground running. You’ll have to do it sometime, and this will be in a friendly environment!

7.1 Why papers?
I think that this approach helps to balance the class. Folks with a lot of quantitative experience will be able to use that to their advantage while folks with more substantial preparation in writing, argument, and logical structure will be able to use those abilities. We will be using the most up-to-date oceanographic datasets available, and so the work you are doing is potentially cutting edge research (but that’s up to you!). Also, in the future you will be expected to write much more complicated papers in a more tightly constrained time frame, you might as well get some practice now.

7.2 Peer review
In addition to writing the papers, you will each be performing anonymous reviews of each others work. This will give you an opportunity to read closely about topics other than the one you chose, and hopefully you will be able to learn about science writing more quickly. Also, there are a lot of quandaries that arise
in peer-reviewing (e.g., one reviewer loves it and one hates it, or a reviewer makes incorrect statements), so you’ll get some experience with those issues by practice in a friendly environment.

We will be using a rubric based on the AGU guidelines for review. They are a useful guideline to go by, and when you do reviews of your fellow students, I’ll expect to get a A1 or B2 or B1 score, etc.

There are a few lessons to be learned here, that will help you write your own papers and will help you provide effective and useful reviews in your career.

- Learning to spot unfounded claims
- Learning how to properly support claims
- Learning to distinguish poor writing from poor thinking
- Learning to label equations, graphs, and numerical information understandably
- Learning about a broader swath of oceanography than those isolated topics you choose for your own papers.

7.3 What will we do with all these peer-reviewed papers?

As the semester continues, there will be some papers of yours that you like quite a bit, or that were very positively reviewed. Either you or me can designate them as ‘publishable’, so that the whole class can see them and subsequent classes can, too. At the end of the semester, all of you will be able to access the assembled published papers: ‘Proceedings of GEOL1100: Notions for the Motions of the Oceans, Spring 2013’. You can use this proceedings for your future reference, and it will be available for future GEOL1100 inductees. It is up to you which papers you want published (if any).

You can access the previous year’s proceedings through the course website with the password I’ve emailed to you. You will find many good ideas and interesting papers there to help you find your way in writing your own.

8 Policies

8.1 Deadlines

Because of the reviewing process, the scheduling of assignments is tight. Thus, I will have to insist that all papers be turned in on time. If they are late, they will drop a letter grade. If they are really late (so that they mess up the next step in the reviewing process) they will be counted as missed and can not be made up. If you foresee that there are big problems coming up (medical, family, etc.) let me know before an assignment is due and we can figure something out.

8.2 Collaboration

I encourage you to work together, and I do not mind at all if you have similar papers or share figures or matlab scripts. However, in this case, I want you to list all of your study group as co-authors or put them in the acknowledgments section of your paper. You are all required to submit a version of each assignment as first author (that is, one that you wrote yourself). You need to be careful to cite your colleagues or the textbooks or papers you might be working from. You can use as much of these resources as is convenient in your version of the paper, but you need to properly cite the sources. We will discuss this topic more as the class (and the inevitable trouble) ensues. These issues of plagiarism and proper sourcing are a big part of what is to be learned in this method of assignments.

A few other items.

- Attendance is expected. If you will miss a class, please let me know when and why so I can be sure you’ll get any announcements, etc.
• Clothing and behavior (e.g., cell phone use) should be appropriate for a learning environment.
• Discrimination and harassment will not be tolerated.
• Please contact me if you have any disabilities that require accommodation.
